Abstract First, a class of comprehensive higher order exponential type generalized \( B-(b, \rho, \eta, \theta, \bar{p}, \bar{r}, \bar{s}) \)-invexities is introduced, which encompasses most of the existing generalized invexity concepts in the literature, including the Antczak type first order \( B-(b, \eta, \bar{p}, \bar{r}) \)-invexities as well as the Zalmai type \( (\alpha, \beta, \gamma, \eta, \rho, \theta) \)-invexities, and then a wide range of parametrically sufficient optimality conditions leading to the solvability for discrete minimax fractional programming problems are established with some other related results. To the best of our knowledge, the obtained results are new and general in nature relating the investigations on generalized higher order exponential type invexities.

Keywords: Generalized higher order invexity, Minimax fractional programming, optimal solutions, sufficient optimality conditions

1. Introduction

Recently, Zalmai [41], in a series of publications based on the work of Antczak [1, 2, 3], generalized the exponential type of invexities and applied to a class of global parametric sufficient optimality criteria using various assumptions for semiinfinite discrete minimax fractional programming problems. Furthermore, Zalmai [41], applying certain suitable partitioning schemes investigated various sets of generalized parametric sufficient optimality results each of which is in fact a family of such results whose members can easily be identified by appropriate choices of certain sets and functions. Antczak [1, 2, 3] introduced and studied first order exponential type \( B-(\rho, \theta) \)-invexities and applied investigating nonlinear mathematical programming problems, especially in [2] Antczak proved some optimality conditions for a class of generalized fractional programming problems involving \( B-(\rho, \theta) \)-invex functions. This work was followed by developing various duality models relating to fractional programming problems in the literature. Verma [30] introduced the second order \( (\Phi, \Psi, \rho, \eta, \theta) \)-invexities to the context of parametric sufficient optimality conditions in semiinfinite discrete minimax fractional programming, while Zalmai and Zhang [42] have established a set of necessary efficiency conditions and a fairly large number of global nonparametric sufficient efficiency results under various frameworks for generalized \( (\eta, \rho) \)-invexity for semi-infinite discrete minimax fractional programming problems. There exists an enormous literature on generalized first order as well as second order invexities with applications. Verma [25] also developed a general framework for a class of \( (\rho, \eta, \theta) \)-invex functions to examine some parametric sufficient efficiency conditions for multiobjective
fractional programming problems for weakly $\epsilon$-efficient solutions. Motivated by the recent advances on $B$-$(p, r)$-invexities and other generalizations to the context of multiobjective fractional programming problems, we first introduce the higher order exponential type $B$-$(b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invexities - a major generalization to Antczak type $B$-$(\tilde{p}, \tilde{r})$-invexities - well-explored and well-cited in the literature, second we establish some parametric sufficient efficiency conditions for multiobjective fractional programming to achieve optimal solutions to multiobjective fractional programming problems, and then we establish some generalized sufficiency results. The results established in this communication, not only generalize the results on Antczak type, Zalmai, and Zalmai and Zhang type first order invexities but also generalize the second order invexity results in general settings.

We consider under the general framework of the second order $B$-$(b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invexities of functions, the following minimax fractional programming problem:

\[
(P) \quad \min_{x \in Q} \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)}
\]

subject to $x \in Q = \{x \in X : H_j(x) \leq 0, j \in \{1, 2, \ldots, m\}\}$, where $X$ is a nonempty open convex subset of $\mathbb{R}^n$ (n-dimensional Euclidean space), $f_i$ and $g_i$ for $i \in \{1, \ldots, p\}$ and $H_j$ for $j \in \{1, \ldots, m\}$ are real-valued functions defined on $X$ such that $f_i(x) \geq 0, g_i(x) > 0$ for $i \in \{1, \ldots, p\}$ and for all $x \in Q$. Here $Q$ denotes the feasible set of $(P)$.

The general theory for semiinfinite programming problems offers a wide range of significant applications to several fields of research, including game theory, industrial engineering, mechanical engineering, statistical analysis, engineering design (including design of control systems, design of earthquakes-resistant structures, digital filters, and electronic circuits), random graphs, boundary value problems, wavelet analysis, environmental protection planning, decision and management sciences, optimal control problems, continuum mechanics, robotics, and data envelopment analysis. For more details, we refer the reader [1 - 44].

2. Generalized second order invexities

The general invexity theory has been investigated in several directions. We generalize the notion of the first order Antczak type $B$-$(\tilde{p}, \tilde{r})$-invexities to the case of the second order $B$-$(b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invexities. These notions of the second order invexity encompass most of the existing notions in the literature. Let $f$ be a twice continuously differentiable real-valued function defined on $X$.

**Definition 2.1**

The function $f$ is said to be second order $B-(b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty)$, and real numbers $\tilde{r}, \tilde{p}$ and $\tilde{s}$ such that for all $x \in X$ and $z \in \mathbb{R}^n$,

\[
b(x, x^*) \left(\frac{1}{\tilde{r}} \left(e^{\tilde{r}|f(x)|} - f(x^*)\right) - 1\right) \geq \frac{1}{\tilde{p}} \left(\langle \nabla f(x^*), e^{\tilde{p} \eta(x, x^*)} z - 1\rangle\right) \\
+ \frac{1}{\tilde{s}} \left(\frac{1}{2} \langle \nabla^2 f(x^*) z, e^{\tilde{s} \omega(x, x^*)} z - 1\rangle\right) \\
+ \rho(x, x^*) \|\theta(x, x^*)\|^2 \quad \text{for } \tilde{p} \neq 0, \tilde{r} \neq 0 \text{ and } \tilde{s} \neq 0,
\]

\[
b(x, x^*) \left(\frac{1}{\tilde{r}} \left(e^{\tilde{r}|f(x)|} - f(x^*)\right) - 1\right) \geq \langle \nabla f(x^*), \eta(x, x^*)\rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*) z\rangle \\
+ \rho(x, x^*) \|\theta(x, x^*)\|^2 \quad \text{for } \tilde{p} = 0, \tilde{s} = 0 \text{ and } \tilde{r} \neq 0,
\]
$$b(x, x^*) \left( [f(x) - f(x^*)] \right) \geq \frac{1}{\rho} \left( \langle \nabla f(x^*), e^{\rho y(x,x^*)} - 1 \rangle \right)$$

+ $\frac{1}{\bar{s}} \left( \frac{1}{2} \langle e^{s \omega(x,x^*)} - 1, \nabla^2 f(x^*)z \rangle \right)$$

+ $\rho(x, x^*)\|\theta(x,x^*)\|^2$ for $\bar{p} \neq 0, \bar{s} \neq 0$ and $\bar{r} = 0,$

$$b(x, x^*) \left( [f(x) - f(x^*)] \right) \geq \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*)z \rangle$$

+ $\rho(x, x^*)\|\theta(x,x^*)\|^2$ for $\bar{p} = 0, \bar{s} = 0$ and $\bar{r} \neq 0,$

where $1 = (1, 1, \cdots, 1) \in \mathbb{R}^n.$

**Definition 2.2**

The function $f$ is said to be second order strictly $B - (b, \rho, \eta, \omega, \theta, \bar{p}, \bar{r}, \bar{s})$-invex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty),$ and real numbers $\bar{r}, \bar{s}$ and $\bar{p}$ such that for all $x \in X$ and $z \in \mathbb{R}^n,$

$$b(x, x^*) \left( \frac{1}{\bar{r}} \left( e^{\bar{r} [f(x) - f(x^*)]} \right) - 1 \right) > \frac{1}{\bar{r}} \left( \langle \nabla f(x^*), e^{\rho y(x,x^*)} - 1 \rangle \right)$$

+ $\frac{1}{\bar{s}} \left( \frac{1}{2} \langle e^{s \omega(x,x^*)} - 1, \nabla^2 f(x^*)z \rangle \right)$

+ $\rho(x, x^*)\|\theta(x,x^*)\|^2$ for $\bar{p} \neq 0, \bar{s} \neq 0$ and $\bar{r} \neq 0,$

$$b(x, x^*) \left( [f(x) - f(x^*)] \right) \geq \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*)z \rangle$$

+ $\rho(x, x^*)\|\theta(x,x^*)\|^2$ for $\bar{p} = 0, \bar{s} = 0$ and $\bar{r} \neq 0.$

**Definition 2.3**

The function $f$ is said to be second order $B - (b, \rho, \eta, \omega, \theta, \bar{p}, \bar{r}, \bar{s})$-pseudoinvex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n,$ and $b : X \times X \to [0, \infty),$ and real numbers $\bar{r}, \bar{s}$ and $\bar{p}$ such that for all $x \in X$ and $z \in \mathbb{R}^n,$

$$\frac{1}{\bar{r}} \left( \langle \nabla f(x^*), e^{\rho y(x,x^*)} - 1 \rangle \right)$$

+ $\frac{1}{\bar{s}} \left( \frac{1}{2} \langle e^{s \omega(x,x^*)} - 1, \nabla^2 f(x^*)z \rangle \right) + \rho(x, x^*)\|\theta(x,x^*)\|^2 \geq 0$

$\Rightarrow b(x, x^*) \left( \frac{1}{\bar{r}} \left( e^{\bar{r} [f(x) - f(x^*)]} \right) - 1 \right) \geq 0$ for $\bar{p} \neq 0, \bar{r} \neq 0$ and $\bar{s} \neq 0,$

$$\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*)z \rangle + \rho(x, x^*)\|\theta(x,x^*)\|^2 \geq 0$$

$\Rightarrow b(x, x^*) \left( \frac{1}{\bar{r}} \left( e^{\bar{r} [f(x) - f(x^*)]} \right) - 1 \right) \geq 0$ for $\bar{p} = 0, \bar{s} = 0$ and $\bar{r} \neq 0.$
\[
\frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) \\
+ \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \right) \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| \geq 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} = 0,
\]

\[
\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*) z \rangle \\
+ \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| \geq 0 \text{ for } \tilde{p} = 0, \tilde{s} = 0, \tilde{r} = 0,
\]

\[
\frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) \\
+ \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \right) \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| \geq 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} = 0,
\]

\[
\frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) \\
+ \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \right) \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| \geq 0 \text{ for } \tilde{p} = 0, \tilde{s} = 0, \tilde{r} = 0,
\]

\[
\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| > 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} = 0,
\]

\[
\frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) \\
+ \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \right) \\
\Rightarrow b(x, x^*)(\| f(x) - f(x^*) \| \geq 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} = 0,
\]

equivalently,

\[
b(x, x^*)(\frac{1}{\tilde{p}} (e^{\tilde{p}|f(x) - f(x^*)|} - 1) \leq 0 \\
\Rightarrow \frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) + \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 \geq 0 \right) \\
\Rightarrow \frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{\eta}(x,x^*)} - 1 \rangle \right) + \frac{1}{s} \left( \frac{1}{2} (e^{\tilde{p}(x,x^*)} - 1, \nabla^2 f(x^*) z) + \rho(x, x^*) \| \theta(x, x^*) \|^2 < 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} = 0.
\]
**Definition 2.5**

The function $f$ is said to be second order prestrictly $B - (\bar{b}, \rho, \eta, \omega, \theta, \bar{\rho}, \bar{s})$-pseudoinvex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty)$, and real numbers $\bar{\rho}$ and $\bar{s}$ such that for all $x \in X$ and $z \in \mathbb{R}^n$,

$$
\frac{1}{\bar{\rho}} \left( \langle \nabla f(x^*), e^\bar{\rho}(x, x^*) \rangle - 1 \right) + \frac{1}{\bar{s}} \left( \frac{1}{2} \langle \nabla f(x^*) z, b(x, x^*) \rangle - 1 \right) \geq 0 \quad \text{for } \bar{\rho} \neq 0, \bar{s} \neq 0 \text{ and } \bar{\rho} \neq 0,
$$

$$
\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle z, \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle^2 > 0
$$

$$
\Rightarrow \quad b(x, x^*) \left( \frac{1}{\bar{\rho}} (e^{\bar{\rho} f(x) - f(x^*)} - 1) \right) \geq 0 \quad \text{for } \bar{\rho} = 0, \bar{s} = 0 \text{ and } \bar{\rho} = 0,
$$

$$
\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle z, \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle^2 > 0
$$

$$
\Rightarrow \quad b(x, x^*) \left( \langle f(x) - f(x^*) \rangle \right) \geq 0 \quad \text{for } \bar{\rho} = 0 \text{ and } \bar{\rho} = 0.
$$

**Definition 2.6**

The function $f$ is said to be second order $B - (\bar{b}, \rho, \eta, \omega, \theta, \bar{\rho}, \bar{s})$-quasiinvex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty)$, and real numbers $\bar{\rho}$, $\bar{s}$ and $\bar{\rho}$ such that for all $x \in X$ and $z \in \mathbb{R}^n$,

$$
b(x, x^*) \left( \frac{1}{\bar{\rho}} (e^{\bar{\rho} f(x) - f(x^*)} - 1) \right) \leq 0
$$

$$
\Rightarrow \quad \frac{1}{\bar{\rho}} \left( \langle \nabla f(x^*), e^\bar{\rho}(x, x^*) \rangle - 1 \right) + \frac{1}{\bar{s}} \left( \frac{1}{2} \langle \nabla f(x^*) z, b(x, x^*) \rangle - 1 \right) \leq 0 \quad \text{for } \bar{\rho} \neq 0, \bar{s} \neq 0 \text{ and } \bar{\rho} \neq 0,
$$

$$
\langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle^2 \leq 0 \quad \text{for } \bar{\rho} = 0, \bar{s} = 0 \text{ and } \bar{\rho} \neq 0,
$$

$$
\Rightarrow \quad \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle^2 \leq 0 \quad \text{for } \bar{\rho} = 0, \bar{s} = 0 \text{ and } \bar{\rho} \neq 0,
$$

The function \( b(x, x^*) \left( [f(x) - f(x^*)] \right) \leq 0 \)
\[
\Rightarrow \frac{1}{p} \left( \langle \nabla f(x^*), e^\rho(x,x^*) \rangle - 1 \right) \\
+ \frac{1}{2s} \left( e^\rho(x,x^*) - 1, \nabla^2 f(x^*) z \right) + \rho(x, x^*) \|\theta(x, x^*)\|^2 \leq 0
\]
for \( \rho \neq 0, \, s \neq 0 \) and \( \bar{r} = 0 \).

**Definition 2.7**

The function \( f \) is said to be second order strictly \( B - \left( b, \rho, \eta, \omega, \theta, \bar{p}, \bar{s}, \bar{r} \right) \)-quasiconvex at \( x^* \in X \) if there exist functions \( \eta, \omega, \theta : X \times X \to \mathbb{R}^n \) and \( b : X \times X \to [0, \infty) \), and real numbers \( \bar{r}, \bar{s} \) and \( \bar{p} \) such that for all \( x \in X \) and \( z \in \mathbb{R}^n \),

\[
b(x, x^*) \left( \frac{1}{p} \left( e^p[f(x) - f(x^*)] - 1 \right) \right) \leq 0 \\
\Rightarrow \frac{1}{p} \left( \langle \nabla f(x^*), e^{\rho(x,x^*)} \rangle - 1 \right) \\
+ \frac{1}{2s} \left( \frac{1}{2} e^{\rho(x,x^*)} - 1, \nabla^2 f(x^*) z \right) + \rho(x, x^*) \|\theta(x, x^*)\|^2 < 0 \text{ for } \rho \neq 0, \, s \neq 0 \text{ and } \bar{r} \neq 0,
\]

\[
b(x, x^*) \left( \frac{1}{p} \left( e^p[f(x) - f(x^*)] - 1 \right) \right) \leq 0 \\
\Rightarrow \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla f(x^*) z \rangle \\
+ \rho(x, x^*) \|\theta(x, x^*)\|^2 < 0 \text{ for } \rho = 0, \, s = 0 \text{ and } \bar{r} \neq 0,
\]

\[
b(x, x^*) \left( [f(x) - f(x^*)] \right) \leq 0 \\
\Rightarrow \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla f(x^*) z \rangle \\
+ \rho(x, x^*) \|\theta(x, x^*)\|^2 < 0 \text{ for } \rho \neq 0, \, s \neq 0 \text{ and } \bar{r} = 0,
\]

\[
b(x, x^*) \left( [f(x) - f(x^*)] \right) \leq 0 \\
\Rightarrow \langle \nabla f(x^*), \eta(x, x^*) \rangle + \frac{1}{2} \langle \omega(x, x^*), \nabla f(x^*) z \rangle \\
+ \rho(x, x^*) \|\theta(x, x^*)\|^2 < 0 \text{ for } \rho = 0, \, s = 0 \text{ and } \bar{r} = 0.
\]
Definition 2.8
The function $f$ is said to be second order prestrictly $B - (b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{s})$-quasiconvex at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty)$, and real numbers $\tilde{p}$ and $\tilde{s}$ such that for all $x \in X$ and $z \in \mathbb{R}^n$,

\begin{align*}
&b(x, x^*) \left( \frac{1}{\tilde{p}} \left( e^{\tilde{p} f(x) - f(x^*)} \right) - 1 \right) < 0 \\
\Rightarrow & \frac{1}{\tilde{p}} \left( \langle \nabla f(x^*), e^{\tilde{p} \eta(x,x^*)} - 1 \rangle \right) + \frac{1}{2\tilde{s}} \left( e^{\tilde{s} \omega(x,x^*)} - 1, \nabla^2 f(x^*) z \right) \\
&+ \rho(x, x^*) \| \theta(x, x^*) \|^2 \leq 0 \text{ for } \tilde{p} \neq 0, \tilde{s} \neq 0 \text{ and } \tilde{r} \neq 0, \\
&b(x, x^*) \left( \frac{1}{\tilde{p}} \left( e^{\tilde{p} f(x) - f(x^*)} \right) - 1 \right) < 0 \\
\Rightarrow & \langle \nabla f(x^*), \eta(x,x^*) \rangle + \frac{1}{2} \langle \omega(x,x^*), \nabla^2 f(x^*) z \rangle \\
&+ \rho(x, x^*) \| \theta(x, x^*) \|^2 \leq 0 \text{ for } \tilde{p} = 0, \tilde{s} = 0 \text{ and } \tilde{r} = 0,
\end{align*}

equivalently,

\begin{align*}
&b(x, x^*) \left( \frac{1}{\tilde{p}} \left( e^{\tilde{p} f(x) - f(x^*)} \right) - 1 \right) < 0 \\
\Rightarrow & \langle \nabla f(x^*), \eta(x,x^*) \rangle \\
&+ \frac{1}{2} \langle \omega(x,x^*), \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \| \theta(x, x^*) \|^2 \leq 0 \text{ for } \tilde{p} = 0, \tilde{s} = 0 \text{ and } \tilde{r} = 0,
\end{align*}

Next, we present some examples which shall reflect the interrelationship among the basic definitions introduced (and applied) in this paper.

Example 2.1
The function $f$ is said to be second order $B - (b, \rho, \eta, \theta, \tilde{p}, \tilde{s})$-pseudoconvex with respect to $\eta$ and $b$ at $x^* \in X$ if there exist functions $\eta, \theta : X \times X \to \mathbb{R}^n$ and $b : X \times X \to [0, \infty)$, and real numbers $\tilde{r}, \tilde{s}$ and $\tilde{p}$ such that for all
Let \( x \in X \) and \( z \in \mathbb{R}^n \),
\[
\frac{1}{p} \left( \langle \nabla f(x^*), e^{\rho_j(x^*)} - 1 \rangle \right) + \frac{1}{s} \left( \frac{1}{2} \langle e^{\rho_j} - 1, \nabla^2 f(x^*) z \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle \right) \geq 0
\]
\[
\Rightarrow b(x, x^*) \left( \frac{1}{p} (e^{\rho_j} - f(x^*)) - 1 \right) \geq 0 \text{ for } \tilde{p} \neq 0 \text{ and } \tilde{r} \neq 0.
\]

**Example 2.2**

The function \( f \) is said to be second order \( B - (b, \rho, \eta, \theta, \tilde{p}, \tilde{r}) \)-pseudoinvex with respect to \( \eta \) and \( b \) at \( x^* \in X \) if there exist functions \( \eta, \theta : X \times X \to \mathbb{R}^n \) and \( b : X \times X \to [0, \infty) \), and real numbers \( \tilde{r} \) and \( \bar{p} \) such that for all \( x \in X \) and \( z \in \mathbb{R}^n \),
\[
\frac{1}{p} \left( \langle \nabla f(x^*), e^{\rho_j(x^*)} - 1 \rangle \right) + \frac{1}{2} \nabla^2 f(x^*) z, e^{\rho_j(x^*)} - 1 \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle \geq 0
\]
\[
\Rightarrow b(x, x^*) \left( \frac{1}{p} (e^{\rho_j} - f(x^*)) - 1 \right) \geq 0 \text{ for } \bar{p} \neq 0 \text{ and } \bar{r} \neq 0.
\]

**Example 2.3**

(Zalmai [41]) The function \( f \) is said to be first order \( B - (b, \rho, \eta, \theta, \tilde{p}, \tilde{r}) \)-pseudoinvex with respect to \( \eta \) and \( b \) at \( x^* \in X \) if there exist functions \( \eta, \theta : X \times X \to \mathbb{R}^n \) and \( b : X \times X \to [0, \infty) \), and real numbers \( \tilde{r} \) and \( \bar{p} \) such that for all \( x \in X \) and \( z \in \mathbb{R}^n \),
\[
\frac{1}{p} \left( \langle \nabla f(x^*), e^{\rho_j(x^*)} - 1 \rangle \right) + \frac{1}{2} \nabla^2 f(x^*) z, e^{\rho_j(x^*)} - 1 \rangle + \rho(x, x^*) \langle \theta(x, x^*) \rangle \geq 0
\]
\[
\Rightarrow b(x, x^*) \left( \frac{1}{p} (e^{\rho_j} - f(x^*)) - 1 \right) \geq 0 \text{ for } \bar{p} \neq 0 \text{ and } \bar{r} \neq 0.
\]

We shall use the following auxiliary results which are crucial to the overall development of the main results on hand.

**Lemma 2.1**

For each \( x \in X \),
\[
\varphi(x) \equiv \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)} = \max_{u \in U} \frac{\sum_{j=1}^{p} u_i f_i(x)}{\sum_{j=1}^{p} u_i g_i(x)}.
\]

**Theorem 2.1**

[28] Let \( x^* \in \mathbb{R} \) and \( \lambda^* = \max_{1 \leq i \leq p} f_i(x^*)/g_i(x^*) \), for each \( i \in p \), let \( f_i \) and \( g_i \) be twice continuously differentiable at \( x^* \), for each \( j \in q \), let the function \( z \to G_j(z, t) \) be twice continuously differentiable at \( x^* \) for all \( t \in T_j \), and for each \( k \in \mathbb{R} \), let the function \( z \to H_k(z, s) \) be twice continuously differentiable at \( x^* \) for all \( s \in \mathbb{R} \). If \( x^* \) is an optimal solution of (P), if the second order generalized Abadie constraint qualification holds at \( x^* \), and if for any critical direction \( y \), the set cone
\[
\left\{ \langle \nabla G_j(x^*, t), (y, \nabla^2 G_j(x^*, t)y) \rangle : t \in T_j(x^*), j \in q \right\}
\]
\[
+ \text{ span}\left\{ \langle \nabla H_k(x^*, s), (y, \nabla^2 H_k(x^*, s)y) \rangle : s \in S_k, k \in \mathbb{R} \right\},
\]
where \( T_j(x^*) = \{ t \in T_j : G_j(x^*, t) = 0 \} \), is closed, then there exist \( u^* \in U \equiv \{ u \in \mathbb{R}^p : u \geq 0, \sum_{i=1}^{p} u_i = 1 \} \) and integers \( \nu_0^* \) and \( \nu^* \), with \( 0 \leq \nu_0^* \leq \nu^* \leq n + 1 \), such that there exist \( \nu_0^* \) indices \( j_m \), with \( 1 \leq j_m \leq q \), together with \( \nu_0^* \) points \( t_m^* \in T_j(x^*) \), \( m \in \nu_0^* \), \( \nu^* - \nu_0^* \) indices \( k_m \), with \( 1 \leq k_m \leq r \), together with \( \nu^* - \nu_0^* \) points \( s_m^* \in S_k \), for \( m \in \nu^* \setminus \nu_0^* \), and \( \nu^* \) real
numbers $v^*_m$, with $v^*_m > 0$ for $m \in \nu_0^*$, with the property that

$$
\sum_{i=1}^{p} u^*_i [\nabla f_i(x^*) - \lambda^*(\nabla g_i(x^*))] + \sum_{m=1}^m v^*_m [\nabla G_{jm}(x^*, t^m)]
$$

$$
+ \sum_{m=\nu_0^*+1}^{\mu^*} v^*_m \nabla H_k(x^*, s^m) = 0,
$$

(2.1)

$$
\langle y, \left[ \sum_{i=1}^{p} u^*_i [\nabla^2 f_i(x^*) - \lambda^* \nabla^2 g_i(x^*)] + \sum_{m=1}^{\nu_0^*} v^*_m \nabla^2 G_{jm}(x^*, t^m) \right] \rangle \geq 0,
$$

(2.2)

where $T_{jm}(x^*) = \{ t \in T_{jm} : G_{jm}(x^*, t) = 0 \}$, $U = \{ u \in \mathbb{R}^p : u \geq 0, \sum_{i=1}^{p} u_i = 1 \}$, and $\nu^* \setminus \nu_0^*$ is the complement of the set $\nu_0^*$ relative to the set $\nu^*$.

3. Second Order sufficient optimality conditions

This section deals with some parametric sufficient efficiency conditions for problem (P) under the generalized frameworks of second order $B - (b, p, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invexities for generalized invex functions. We start with real-valued functions $E_i(., x^*, u^*)$ and $B_j(., v)$ defined by

$$
E_i(x, x^*, u^*) = u_i [f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)], \ i \in \{1, \cdots, p\}
$$

and

$$
B_j(., v) = v_j H_j(x), \ j = 1, \cdots, m.
$$

**Theorem 3.1**

Let $x^* \in Q$, functions $f_i, g_i$ for $i \in \{1, \cdots, p\}$ with $\varphi(x^*) = \frac{f_i(x^*)}{g_i(x^*)} \geq 0$, $g_i(x^*) > 0$ and $H_j$ for $j \in \{1, \cdots, m\}$ be twice continuously differentiable at $x^* \in Q$, and let there exist $u^* \in U = \{ u \in \mathbb{R}^p : u > 0, \sum_{i=1}^{p} u_i = 1 \}$ and $\nu^* \in \mathbb{R}^+_m$ such that

$$
\sum_{i=1}^{p} u^*_i \left[ \nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*) \right] + \sum_{j=1}^{m} v^*_j \nabla H_j(x^*) = 0,
$$

(3.1)

$$
\langle z, \left[ \sum_{i=1}^{p} u^*_i \left[ \nabla^2 f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*) \right] + \sum_{j=1}^{m} v^*_j \nabla^2 H_j(x^*) \right] z \rangle \geq 0,
$$

(3.2)

where $z \in \mathbb{R}^n$, and

$$
v^*_j H_j(x^*) = 0, \ j \in \{1, \cdots, m\}.
$$

(3.3)

Suppose, in addition, that any one of the following assumptions holds:
(i) $E_i(\cdot, x^*, u^*) \forall i \in \{1, \cdots, p\}$ are second order $B - (b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-pseudoinvex with respect to $\eta$, $\omega$ and $b$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$ and $z \in \mathbb{R}^n$ with $b(x, x^*) > 0$; and $B_{ij}(\cdot, v^*) \forall j \in \{1, \cdots, m\}$ are second order $B - (\tilde{b}, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-quasiinvex with respect to $\eta$, $\omega$ and $\tilde{b}$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$, $z \in \mathbb{R}^n$, and $\rho(x, x^*) \geq 0$.

(ii) $E_i(\cdot, x^*, u^*) \forall i \in \{1, \cdots, p\}$ are second order $B - (b, \rho_1, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-pseudoinvex with respect to $\eta$, $\omega$ and $b$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$ and $z \in \mathbb{R}^n$ with $b(x, x^*) > 0$; and $B_{ij}(\cdot, v^*) \forall j \in \{1, \cdots, m\}$ are second order strictly $B - (\tilde{b}, \rho_2, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-quasiinvex with respect to $\eta$, $\omega$ and $\tilde{b}$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$, $z \in \mathbb{R}^n$, and $\rho_1(x, x^*), \rho_2(x, x^*) \geq 0$ with $\rho_2(x, x^*) \geq \rho_1(x, x^*)$.

(iii) $E_i(\cdot, x^*, u^*) \forall i \in \{1, \cdots, p\}$ are second order prestrictly $B - (b, \rho_1, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-pseudoinvex with respect to $\eta$, $\omega$ and $b$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$ and $z \in \mathbb{R}^n$ with $b(x, x^*) > 0$; and $B_{ij}(\cdot, v^*) \forall j \in \{1, \cdots, m\}$ are second order strictly $B - (\tilde{b}, \rho_2, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-quasiinvex with respect to $\eta$, $\omega$ and $\tilde{b}$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$, $z \in \mathbb{R}^n$, and $\rho_1(x, x^*), \rho_2(x, x^*) \geq 0$ with $\rho_2(x, x^*) \geq \rho_1(x, x^*)$.

(iv) $E_i(\cdot, x^*, u^*) \forall i \in \{1, \cdots, p\}$ are second order prestrictly $B - (b, \rho_1, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-quasiinvex with respect to $\eta$, $\omega$ and $b$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$ and $z \in \mathbb{R}^n$ with $b(x, x^*) > 0$; and $B_{ij}(\cdot, v^*) \forall j \in \{1, \cdots, m\}$ are second order strictly $B - (\tilde{b}, \rho_2, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-pseudoinvex with respect to $\eta$ and $\tilde{b}$ at $x^* \in X$ if there exist functions $\eta, \omega, \theta : X \times X \rightarrow \mathbb{R}^n$ and $b : X \times X \rightarrow \mathbb{R}_+ = [0, \infty)$, and real numbers $\tilde{r}$, $\tilde{s}$ and $\tilde{p}$ for all $x \in X$, $z \in \mathbb{R}^n$, and $\rho_1(x, x^*), \rho_2(x, x^*) \geq 0$ with $\rho_2(x, x^*) \geq \rho_1(x, x^*)$.

(v) For each $i \in \{1, \cdots, p\}$, $f_i$ is second order $B - (b, \rho_1, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invex and $-g_i$ is second order $B - (\tilde{b}, \rho_3, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-invex at $x^*$ with $b(x, x^*) > 0$. $H_j(\cdot, v^*) \forall j \in \{1, \cdots, m\}$ is $B - (\tilde{b}, \rho_3, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s})$-quasi-invex at $x^*$, and $\sum_{j=1}^m v_j^* \rho_3 + \rho^* \geq 0$ for $\rho^* = \sum_{i=1}^p u_i^*(\rho_1 + \phi(x)\rho_2)$ and for $\phi(x^*) = f_i(x^*) / g_i(x^*)$.

Then $x^*$ is an optimal solution to (P).

Proof
If (i) holds, and if $x \in Q$, then it follows from (3.1) and (3.2) that

$$
\frac{1}{\rho^*} \left( \sum_{i=1}^p u_i^* [\nabla f_i(x^*) - \frac{f_i(x^*)}{g_i(x^*)} \nabla g_i(x^*)] \nabla \rho^*(x, x^*) - 1 \right) = 0 \forall x \in Q,
$$

$$
\frac{1}{2s} \left( \rho^*(x, x^*) - 1 \right) \left[ \sum_{i=1}^p u_i^* \nabla^2 f_i(x^*) - \frac{f_i(x^*)}{g_i(x^*)} \nabla^2 g_i(x^*) + \sum_{j=1}^m v_j^* \nabla^2 H_j(x^*) \right] z \geq 0.
$$

Since $v^* \geq 0$, $x \in Q$ and (3.3) holds, we have

$$
\sum_{j=1}^m v_j^* H_j(x) \leq 0 = \sum_{j=1}^m v_j^* H_j(x^*),
$$

and so
\[
\bar{b}(x, x^*) \left( \frac{1}{p} \left( e^{\bar{r}[H_i(x) - H_i(x^*)]} - 1 \right) \right) \leq 0
\]
since \( \bar{r} \neq 0 \) and \( \bar{b}(x, x^*) \geq 0 \) for all \( x \in Q \). In light of the \( B - (\bar{b}, \rho, \eta, \theta, \bar{p}, \bar{r}, \bar{s}) \)-quasiinvexity of \( B_j(., v^*) \) at \( x^* \), it follows that
\[
\frac{1}{p} \left( \langle \nabla H_j(x^*), e^{\bar{r}g_j(x,x^*)} - 1 \rangle \right) + \frac{1}{8} \left( \frac{1}{2} e^{\bar{r}g_j(x,x^*)} - 1, \nabla^2 H_j(x^*)z \right) + \rho(x, x^*)\|\theta(x, x^*)\|^2 \leq 0,
\]
and hence,
\[
\frac{1}{p} \left( \sum_{j=1}^m \langle \nabla H_j(x^*), e^{\bar{r}g_j(x,x^*)} - 1 \rangle \right) + \frac{1}{8} \left( \frac{1}{2} e^{\bar{r}g_j(x,x^*)} - 1, \sum_{j=1}^m \nabla^2 H_j(x^*)z \right) + \rho(x, x^*)\|\theta(x, x^*)\|^2 \leq 0. \tag{3.6}
\]
It follows from (3.4), (3.5) and (3.6) that
\[
\frac{1}{p} \left( \sum_{i=1}^p u_i^* [\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)] e^{\bar{r}g_i(x,x^*)} - 1 \right) + \frac{1}{8} \left( \frac{1}{2} e^{\bar{r}g_i(x,x^*)} - 1, \sum_{i=1}^p \nabla^2 f_i(x^*)z - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*)z \right) \geq \rho(x, x^*)\|\theta(x, x^*)\|^2. \tag{3.7}
\]
Since \( \rho(x, x^*) \geq 0 \), applying \( B - (b, \rho, \eta, \theta, \bar{p}, \bar{r}, \bar{s}) \)-pseudo-invexity at \( x^* \) to (3.7), we have
\[
\frac{1}{p} b(x, x^*) \left( e^{\bar{r}[E_i(x,x^*,u^*) - E_i(x^*,x^*,u^*)]} - 1 \right) \geq 0. \tag{3.8}
\]
Since \( b(x, x^*) > 0 \), (3.8) implies
\[
\sum_{i=1}^p u_i^* \left[ f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x) \right] \geq \sum_{i=1}^p u_i^* \left[ f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x^*) \right] = 0.
\]
Thus, we have
\[
\sum_{i=1}^p u_i^* \left[ f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x) \right] \geq 0. \tag{3.9}
\]
Since \( u_i^* > 0 \) for each \( i \in \{1, \cdots, p\} \), we conclude using Lemma 2.1 that
\[
\varphi(x) = \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)} = \max_{u \in U} \sum_{i=1}^p u_i^* f_i(x) \geq \max_{u \in U} \sum_{i=1}^p u_i^* g_i(x) = \varphi(x^*).
\]
Since \( x \in Q \) is arbitrary, \( x^* \) is an optimal solution to (P).
The proof for (ii) is similar to that of (i), but we include for the sake of the completeness. If (ii) holds, and if \( x \in Q \), then it follows from (3.1) and (3.2) that
\[
\frac{1}{p} \left( \sum_{i=1}^{p} u_i^* [\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)], e^{\bar{\eta}_n(x,x^*)} - 1 \right) \\
+ \frac{1}{p} \left( \sum_{j=1}^{m} v_j^* \nabla H_j(x^*), e^{\bar{\eta}_n(x,x^*)} - 1 \right) = 0 \quad \forall \ x \in Q, \tag{3.10}
\]
and
\[
\frac{1}{s} \left( e^{\bar{\omega}_n(x,x^*)} - 1, \sum_{i=1}^{p} u_i^* [\nabla^2 f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*)] + \sum_{j=1}^{m} v_j^* \nabla^2 H_j(x^*) \right) z \geq 0. \tag{3.11}
\]
Since \( v^* \geq 0, x \in Q \) and (3.3) holds, we have
\[
\Sigma_{j=1}^{m} v_j^* H_j(x) \leq 0 = \Sigma_{j=1}^{m} v_j^* H_j(x^*),
\]
and so
\[
b(x, x^*) \left( \frac{1}{p} \left( e^{\frac{\bar{\eta}_n(x, x^*)}{H_j(x^*)}} - 1 \right) - 1 \right) \leq 0
\]
since \( \bar{\eta} \neq 0 \) and \( \bar{b}(x, x^*) \geq 0 \) for all \( x \in Q \). In light of the \( B - (b, \rho_2, \eta, \omega, \theta, \bar{\eta}, \bar{\rho}) \)-quasiinvexity of \( B_j(., v^*) \) at \( x^* \), it follows that
\[
\frac{1}{p} \left( \nabla H_j(x^*), e^{\bar{\eta}_n(x,x^*)} - 1 \right) + \frac{1}{s} \left( e^{\bar{\omega}_n(x,x^*)} - 1, \nabla^2 H_j(x^*) z \right) + \rho_2(x, x^*) \| \theta(x, x^*) \|^2 \leq 0,
\]
and hence,
\[
\frac{1}{p} \left( \Sigma_{j=1}^{m} \nabla H_j(x^*), e^{\bar{\eta}_n(x,x^*)} - 1 \right) + \frac{1}{s} \left( e^{\bar{\omega}_n(x,x^*)} - 1, \Sigma_{j=1}^{m} \nabla^2 H_j(x^*) z \right) + \rho_2(x, x^*) \| \theta(x, x^*) \|^2 \leq 0. \tag{3.12}
\]
It follows from (3.10), (3.11) and (3.12) that
\[
\frac{1}{p} \left( \sum_{i=1}^{p} u_i^* [\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)], e^{\bar{\eta}_n(x,x^*)} - 1 \right) \\
+ \frac{1}{s} \left( \frac{1}{2} \left( e^{\bar{\omega}_n(x,x^*)} - 1, \sum_{i=1}^{p} u_i^* [\nabla^2 f_i(x^*) z - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*) z] \right) \right) \\
\geq \rho_2(x, x^*) \| \theta(x, x^*) \|^2. \tag{3.13}
\]
Since \( \rho_1(x, x^*), \rho_2(x, x^*) \geq 0 \) with \( \rho_2(x, x^*) \geq \rho_1(x, x^*) \), applying \( B - (b, \rho_1, \eta, \omega, \theta, \bar{\eta}, \bar{\rho}) \)-pseudo-invexity at \( x^* \) to (3.13), we have
\[
\frac{1}{p} b(x, x^*) \left( e^{\frac{\bar{\eta}_n(x, x^*)}{E_i(x,x^*,u^*) - E_i(x^*,x^*,u^*)}} - 1 \right) \geq 0. \tag{3.14}
\]
Since \( b(x, x^*) > 0 \), (3.14) implies
\[
\Sigma_{i=1}^{p} u_i^* [f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)] \\
\geq \Sigma_{i=1}^{p} u_i^* [f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x^*)] \\
= 0.
\]
Thus, we have
\[ \Sigma_{i=1}^{p} u_i^* [f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)] \geq 0. \] (3.15)

Since \( u_i^* > 0 \) for each \( i \in \{1, \cdots, p\} \), we conclude using Lemma 2.1 that
\[ \varphi(x) = \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)} = \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^* f_i(x)}{\sum_{i=1}^{p} u_i^* g_i(x)} \geq \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^* f_i(x^*)}{\sum_{i=1}^{p} u_i^* g_i(x^*)} = \varphi(x^*). \]

Since \( \varphi(x) = \varphi(x^*) \), \( x \) is arbitrary, \( x^* \) is an optimal solution to (P).

Next, we start off the proof for (iii) as follows: if (iii) holds, and if \( x \in Q \), then it follows from (3.1) and (3.2) that
\[ \begin{align*}
&\frac{1}{p} \left( \Sigma_{i=1}^{p} u_i^* [\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)], e^{\tilde{\eta}(x^*)} - 1 \right) \\
&\quad \quad + \frac{1}{p} \Sigma_{j=1}^{m} v_j^* \nabla H_j(x^*), e^{\tilde{\eta}(x^*)} - 1 \right) = 0 \forall x \in Q, \tag{3.16}
\end{align*} \]

and
\[ \frac{1}{s} \left( e^{\tilde{\eta}(x^*)} - 1 \right), \left[ \Sigma_{i=1}^{p} u_i^* [\nabla^2 f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*)] + \Sigma_{j=1}^{m} v_j^* \nabla^2 H_j(x^*) \right] \geq 0. \tag{3.17} \]

Since \( v^* \geq 0 \), \( x \in Q \) and (3.3) holds, we have
\[ \Sigma_{j=1}^{m} v_j^* H_j(x) \leq 0 = \Sigma_{j=1}^{m} v_j^* H_j(x^*), \]
which implies
\[ b(x, x^*) \left( \frac{1}{p} \left( e^{\tilde{\eta}(x)} - 1 \right) \right) \leq 0. \]

Then, in light of the strict \( B - (b, \rho, \eta, \theta, \tilde{p}, \tilde{r}, \tilde{s}) \)–quasi-invexity of \( B_j(., v^*) \) at \( x^* \), we have
\[ \frac{1}{p} \left( \nabla H_j(x^*), e^{\tilde{\eta}(x^*)} - 1 \right) + \frac{1}{s} \left( \frac{1}{2} e^{\tilde{\eta}(x^*)} - 1, \nabla^2 H_j(x^*) \right) + \rho(x, x^*) ||\theta(x, x^*)||^2 < 0. \tag{3.18} \]

It follows from (3.3), (3.16), (3.17) and (3.18) that
\[ \begin{align*}
&\frac{1}{p} \left( \Sigma_{i=1}^{p} u_i^* [\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)], e^{\tilde{\eta}(x^*)} - 1 \right) \\
&\quad \quad + \frac{1}{s} \left( \frac{1}{2} e^{\tilde{\eta}(x^*)} - 1, \Sigma_{i=1}^{p} u_i^* [\nabla^2 f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*)] \right) \\
&\quad \quad > \rho(x, x^*) ||\theta(x, x^*)||^2. \tag{3.19}
\end{align*} \]

As a result, since \( \rho(x, x^*) \geq 0 \), applying the prestrict \( (b, \rho, \eta, \theta, \tilde{p}, \tilde{r}, \tilde{s}) \)–pseudo-invexity at \( x^* \) to (3.19), we have
\[ \left( \Sigma_{i=1}^{p} u_i^* [f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)] \right) - \left( \Sigma_{i=1}^{p} u_i^* [f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x^*)] \right) \geq 0, \]
which implies
Then, in light of the equivalent form for the strict and

\[ 3.22 \]

\[ 3.2 \]

It follows from (iv) and (iii), but still we include it as follows: if \( x \in Q \), then it follows from (3.1) and (3.2) that

\[
\sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)] \\
\geq \sum_{i=1}^{p} u_i^*[f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x^*)] \\
= 0.
\]

Thus, we have

\[
\sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) g_i(x)] \geq 0. \tag{3.20}
\]

Since \( u_i^* > 0 \) for each \( i \in \{1, \ldots, p\} \), we conclude using Lemma 2.1 that

\[
\varphi(x) = \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)} = \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^* f_i(x)}{\sum_{i=1}^{p} u_i^* g_i(x)} \geq \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^* f_i(x^*)}{\sum_{i=1}^{p} u_i^* g_i(x^*)} = \varphi(x^*).
\]

Since \( x \in Q \) is arbitrary, \( x^* \) is an optimal solution to (P).

The proof applying (iv) is similar to that of (iii), but still we include it as follows: if \( x \in Q \), then it follows from (3.1) and (3.2) that

\[
\frac{1}{\bar{p}} \left( \sum_{i=1}^{p} u_i^* \left( \frac{\nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*)}{\varphi(x^*)} - 1 \right) \right) + \frac{1}{\bar{p}} \left( \sum_{j=1}^{m} v_j^* \nabla H_j(x^*) - 1 \right) = 0 \forall x \in Q, \tag{3.21}
\]

and

\[
\frac{1}{\delta} \left( e^{\bar{\omega}(x,x^*)} - 1, \left( \sum_{i=1}^{p} u_i^* \left[ \nabla^2 f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*) \right] + \sum_{j=1}^{m} v_j^* \nabla^2 H_j(x^*) \right) z \right) \geq 0. \tag{3.22}
\]

Since \( v^* \geq 0, x \in Q \) and (3.3) holds, we have

\[
\sum_{j=1}^{m} v_j^* H_j(x) \leq 0 = \sum_{j=1}^{m} v_j^* H_j(x^*),
\]

which implies

\[
\bar{b}(x, x^*) \left( \frac{1}{\delta} \left( e^{\bar{\omega}(H_j(x)-H_j(x^*))} - 1 \right) \right) \leq 0.
\]

Then, in light of the equivalent form for the strict \( B - (\bar{b}, \rho, \eta, \omega, \theta, \bar{\rho}, \bar{\omega}) \)–pseudo-invexity of \( B_j(., v^*) \) at \( x^* \), we have

\[
\frac{1}{\bar{p}} \left( \left( \nabla H_j(x^*), e^{\bar{\omega}(x,x^*)} - 1 \right) \right) + \frac{1}{2\bar{\delta}} \left( e^{\bar{\omega}(x,x^*)} - 1, \nabla^2 H_j(x^*) z \right) + \rho(x, x^*) \| \theta(x, x^*) \|^2 < 0.
\]

It follows from (3.3), (3.21) and (3.22) that

\[
\frac{1}{\bar{p}} \left( \sum_{i=1}^{p} u_i^* \left[ \nabla f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla g_i(x^*) \right], e^{\bar{\omega}(x,x^*)} - 1 \right) + \frac{1}{\bar{p}} \left( \sum_{i=1}^{p} u_i^* \nabla^2 f_i(x^*) z - \left( \frac{f_i(x^*)}{g_i(x^*)} \right) \nabla^2 g_i(x^*) z \right) \]

\[
> \rho(x, x^*) \| \theta(x, x^*) \|^2. \tag{3.23}
\]
As a result, since \( \rho(x, x^*) \geq 0 \), applying the the equivalent form for the prestrict \( B - (b, \rho, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s}) \)–quasi-invexity of \( E_i(\cdot; x^*, u^*) \) at \( x^* \) to (3.23), we have

\[
b(x, x^*) \left( \sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x)] - \sum_{i=1}^{p} u_i^*[f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x^*)] \right) \geq 0,
\]

which (since \( b(x, x^*) > 0 \)) implies that

\[
\sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x)] \\
\geq \sum_{i=1}^{p} u_i^*[f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x^*)] \\
= 0.
\]

Thus, we have

\[
\sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x)] \geq 0. \tag{3.24}
\]

Since \( u_i^* > 0 \) for each \( i \in \{1, \cdots, p\} \), we conclude using Lemma 2.1 that

\[
\varphi(x) = \max_{1 \leq i \leq p} \frac{f_i(x)}{g_i(x)} = \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^*[f_i(x) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x)]}{\sum_{i=1}^{p} u_i^*g_i(x)} \geq \max_{u \in U} \frac{\sum_{i=1}^{p} u_i^*[f_i(x^*) - \left( \frac{f_i(x^*)}{g_i(x^*)} \right)g_i(x^*)]}{\sum_{i=1}^{p} u_i^*g_i(x^*)} = \varphi(x^*).
\]

Since \( x \in Q \) is arbitrary, \( x^* \) is an optimal solution to (P).

Finally, we prove (v) as follows: since \( x \in Q \), it follows that

\( H_j(x) \leq H_j(x^*) \), which implies \( \left( H_j(x) - H_j(x^*) \right) \leq 0 \).

Then applying the \( B - (b, \rho_3, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s}) \)–quasi-invexity of \( H_j \) at \( x^* \) and \( v^* \in R_{+}^m \), we have

\[
\frac{1}{\tilde{p}} \left( \sum_{j=1}^{m} v_j^* \nabla H_j(x^*) \right) - \frac{1}{\tilde{p}} \left( e^{\tilde{p}}(x, x^*) - 1 \right)
\]
\[
+ \frac{1}{\tilde{s}} \left( \frac{1}{2} \left( e^{\tilde{s}}(x, x^*) - 1, \sum_{j=1}^{m} v_j^* \nabla^2 H_j(x^*) z \right) \right)
\leq -\sum_{j=1}^{m} v_j^* \rho_3 \|v^*(x, x^*)\|^2.
\]

Since \( u^* \geq 0 \) and \( \frac{f_i(x^*)}{g_i(x^*)} \geq 0 \), it follows from \( B - (b, \rho_3, \eta, \omega, \theta, \tilde{p}, \tilde{r}, \tilde{s}) \)–invexity assumptions that

investigated by Zalmai [38].

Suppose, in addition, that any one of the following assumptions holds:

\[ \text{Theorem 3.2} \]

(i) \( \eta \in \mathbb{R} \) and \( b \in \mathbb{R} \) and \( H_j \) for \( j \in \{1, \ldots, m\} \) be differentiable at \( x^* \in Q \), and let there exist \( u^* \in U = \{ u \in \mathbb{R}^p : u > 0, \Sigma_{i=1}^p u_i = 1 \} \) and \( v^* \in \mathbb{R}^m_+ \) such that

\[ \Sigma_{i=1}^p u_i^* \left[ \nabla f_i(x^*) - \frac{f_i(x^*)}{g_i(x^*)} \nabla g_i(x^*) \right] + \sum_{j=1}^m v_j^* \nabla H_j(x^*) = 0 \]  

(3.25)

and

\[ v_j^* H_j(x^*) = 0, \quad j \in \{1, \ldots, m\}. \]  

(3.26)

Suppose, in addition, that any one of the following assumptions holds:

(i) \( E_i(\cdot, x^*, \cdot) \forall i \in \{1, \ldots, p\} \) are \( B-(b, \rho, \eta, \theta, \varphi, \tilde{r}) \)-pseudoinvex with respect to \( \eta \) and \( b \) at \( x^* \in X \) if there exist a function \( \eta : X \times X \to \mathbb{R}^n \), a function \( b : X \times X \to [0, \infty) \), and real numbers \( \tilde{r} \) and \( \tilde{p} \) such that for all \( x \in X \) and \( z \in \mathbb{R}^n \) with \( b(x, z) > 0 \), and \( B_j(\cdot, v^*) \forall j \in \{1, \ldots, m\} \) are \( B-(b, \rho, \eta, \theta, \varphi, \tilde{r}) \)-quasiinvex with respect to \( \eta \) and \( b \) at \( x^* \in X \) if there exist a function \( \eta : X \times X \to \mathbb{R}^n \), a function \( b : X \times X \to [0, \infty) \), and real numbers \( \tilde{r} \) and \( \tilde{p} \) such that for all \( x \in X \) and \( z \in \mathbb{R}^n \), and \( \rho(x, z) \geq 0 \).
programming problems with generalized invex functions, for instance, based on the work of Mishra et al.

4. Concluding Remarks

Then $x^*$ is an efficient solution to (P).

4. Concluding Remarks

We observe that the obtained results in this communication can be applied to multiobjective fractional subset programming problems with generalized invex functions, for instance, based on the work of Mishra et al. [16] and Verma [29] to the case of the $\epsilon$–efficiency and weak $\epsilon$–efficiency conditions to minimax fractional programming problems involving $n$-set functions. Furthermore, the generalized invexity frameworks developed to this context can also be applied to duality models for a class of multiobjective control problems as well as to a new class of multiobjective variational problems of minimizing a vector of functionals of curvilinear integral type models.
